

GEA Bock Compressors HG44e and HG56e

Semi-hermetic GEA Bock Compressors

Bock compressors HG44e and HG56e

Our solutions are customer-oriented and user-friendly, because they are low-priced, energy-efficient, long-lasting and tailored to your individual needs.

With its GEA Bock HG44e and HG56e compressor ranges, GEA Refrigeration Technologies introduces new, more efficient semi-hermetic compressors to the market – models that replace its HG4 and HG5 ranges. In addition to their uses in the field of refrigeration and air-conditioning, the new compressors are ideally suited for refrigeration in supermarkets. They offer improved efficiency over their predecessors, greater displacement stages, more compact structural design, and a new configuration of connections. These connections match the gas connections normally found in the sector, to ensure that no adaptation work is necessary when the user invests in a replacement compressor. The foot mountings of the new compressor likewise conform to sector standards. In the four-cylinder HG44e range, four model sizes cover the area of maximum displacement from 41.3 m³/h to 67.0 m³/h. Three six-cylinder HG56e models round the spectrum off toward the top with displacements of 73.8 m³/h to 100.4 m³/h.

Special features

Both new ranges profit from a new and advanced valve plate system, electrical motors from the latest generation, and enhanced gas flow – which increase efficiency and lower energy consumption. In comparison to its predecessors, the GEA Bock HG44e range includes four instead of three model sizes. In addition, the largest version, the HG44e/770-4 compressor, offers with its 67 m³/h, almost 20 % more displacement than the largest HG4 model. As a result, this compressor range demonstrates the greatest power density in the sector. With the GEA Bock HG56e range, six-cylinder models are available throughout, instead of the four-cylinder HG5 versions. In comparison to the four-cylinder compressor models usually found on the market, the increase of the number of cylinders leads to enhanced efficiency and optimized running smoothness. Here as well, the largest compressor – with 100.4 m³/h displacement – exceeds that of its predecessor by around one-fifth. The GEA Bock oil-pump design, proven over many years, further assures reliable lubrication of all moving parts. The new models furthermore demonstrate excellent service friendliness – for example, simple exchange of the drive motor, as before. With its new GEA Bock HG44e and HG56e compressors, GEA Refrigeration Technologies sets new standards in efficiency and performance.

INT69 G Motor Protection

Electronic Motor Protection GEA Bock INT69 G

PTC sensors
Connection of up to nine PTC sensors possible

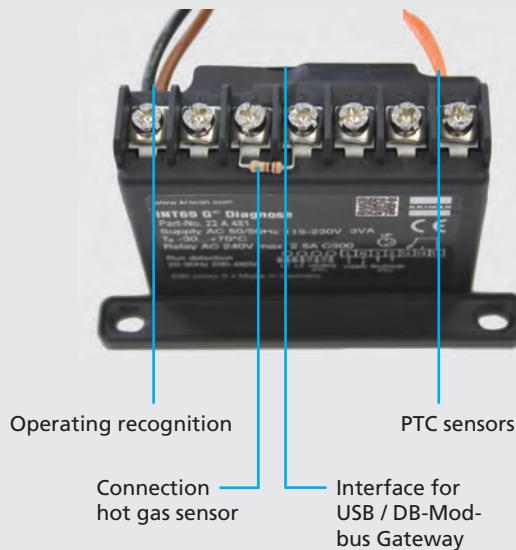

Temperature safety drive for the drive motor

The INT69 G is replacing, in the HG44e/HG56e and in all future new developments, the MP10 compressors used as standard at GEA Bock

The INT69 G also provides the usual functions, as:

- motor temperature monitoring
- hot gas temperature monitoring
- a reconnection preventing device
- a reset

INT69 G Diagnose

Read facility via INTelligence diagnosis software

With the INTelligence software, valuable information can be obtained on the status of the compressor and the system. The diagnosis function includes the plausibility checks of the logic sequences, all important operation and error values of the compressor and provides for its clear visualization.

Crucial evaluation parameters can be configured individually. This allows for a quick analysis and an efficient system management.

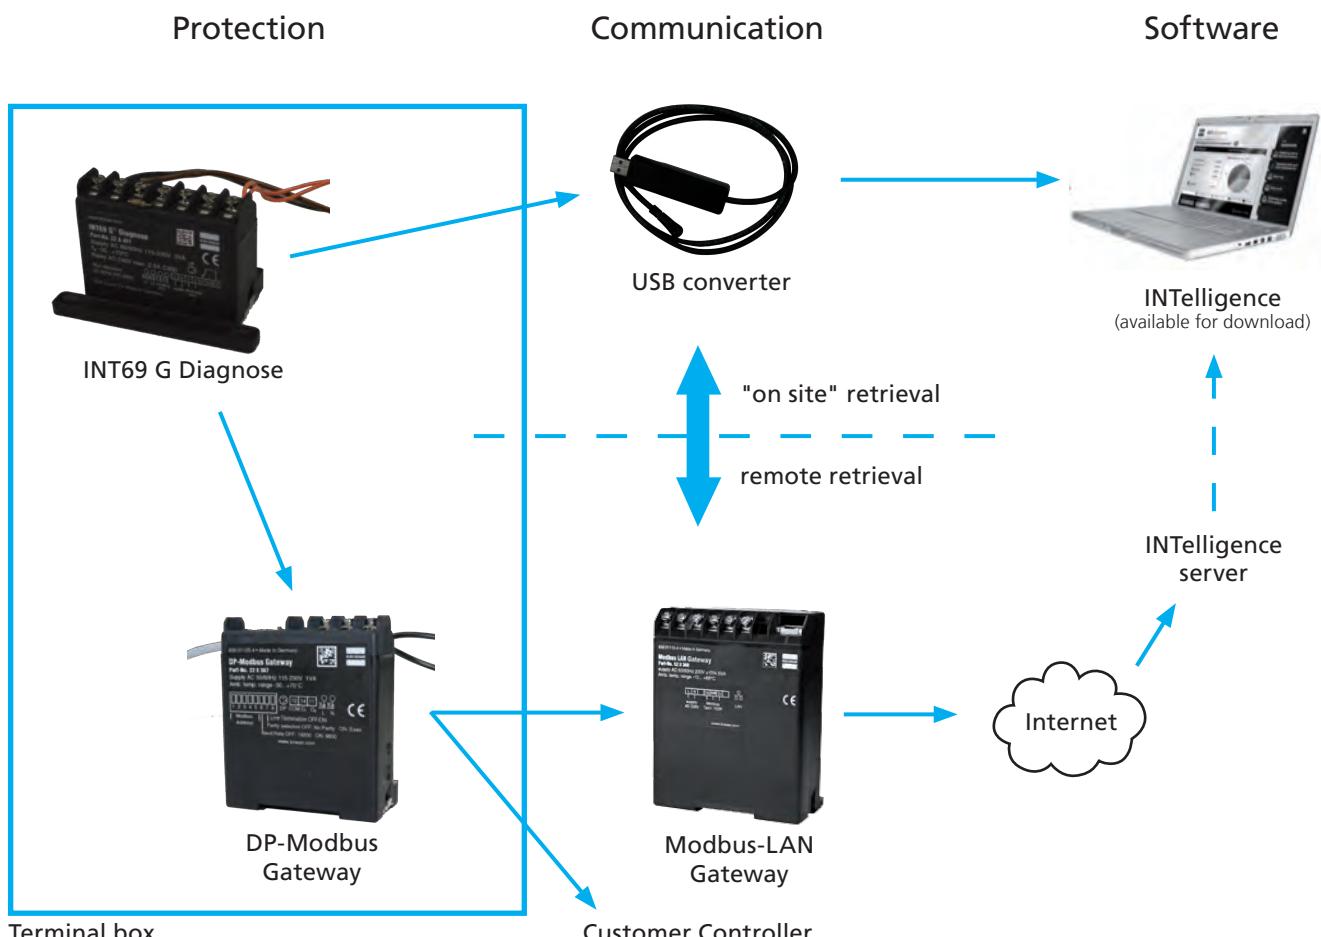

Advantages:

- Simple operation
- Immediate diagnosis and precise problem solving
- Specially adaptable to the user's needs

If required, data can be retrieved directly at each compressor via USB port. A Modbus interface is available for integration in a network.

The data are sent periodically via the DP-Modbus gateway and the Modbus-LAN gateway to a server and can be retrieved remotely by the INTelligence diagnosis software.

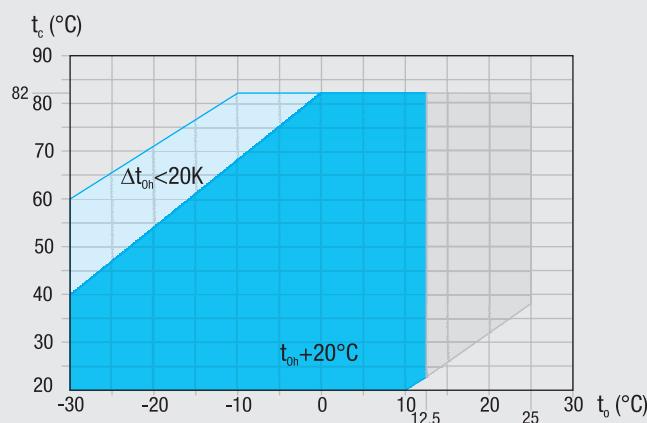

The INTelligence diagnosis software can be downloaded for free at www.kriwan.com.

Further explanation can be found at www.kriwan.com.

In the event of inquiries please contact our Department for Application Technology, phone +49 7022 9454-0.

¹⁾ LP = low pressure HP = high pressure

R134a Notes

Operating limits

Compressor operation is possible within the limits shown on the application diagrams. Please note the coloured areas. Compressor application limits should not be chosen for design purposes or continuous operation.

Restrictions to the operating limits may occur when using the Bock EFC (Electronic Frequency Control).

Further explanation see www.bock.de.

Performance data

The performance data for R134a are based on European Standard EN 12900 50 Hz power supply frequency.

This signifies: 20 °C suction gas temperature without liquid subcooling.

This results in significant differences compared to specifications with liquid undercooling and/or suction-gas temperatures

Conversion factor for 60 Hz = 1,2

Performance data for other operating points, see GEA Bock software.

Relating to 20 °C suction gas temperature
without liquid subcooling.

This performance data is preliminary data!

 Motor version -S-
(more powerful motor)

 Supplementary cooling or
reduced suction gas temp.

R22 Operating limits

- Unlimited application range
 - Supplementary cooling or reduced suction gas temperature
 - Supplementary cooling and reduced suction gas temperature
 - Motor version -S- (more powerful motor)
- t_o Evaporation temperature ($^{\circ}\text{C}$)
 t_c Condensing temperature ($^{\circ}\text{C}$)
 Δt_{oh} Suction gas superheat (K)
 t_{oh} Suction gas temperature ($^{\circ}\text{C}$)

¹⁾ LP = low pressure HP = high pressure

R22 Notes

Operating limits

Compressor operation is possible within the limits shown on the application diagrams. Please note the coloured areas. Compressor application limits should not be chosen for design purposes or continuous operation.

Restrictions to the operating limits may occur when using the Bock EFC (Electronic Frequency Control).

Further explanation see www.bock.de.

Performance data

The performance data for R22 are based on European Standard EN 12900 50 Hz power supply frequency.

This signifies: 20 °C suction gas temperature without liquid sub-cooling

Conversion factor for 60 Hz = 1,2

Performance data for other operating points, see GEA Bock software.

* PW = Part Winding, motors for part winding start 1 = 1. part winding 2 = 2. part winding

Explanations:

① Tolerance ($\pm 10\%$) relates to the mean value of the voltage range.
Other voltages and current types on request.

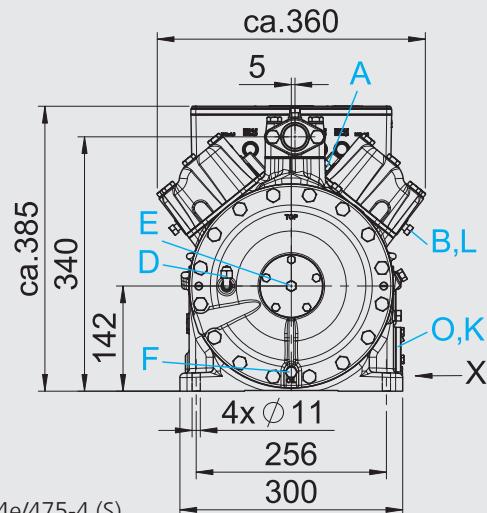

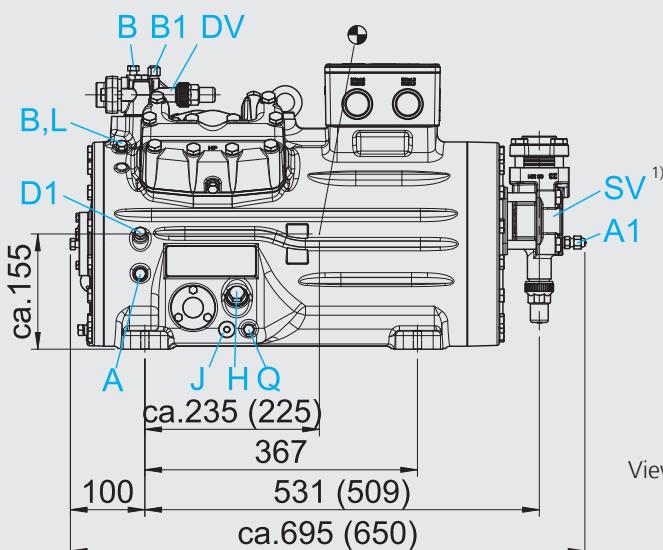

② - The specifications for max. power consumption apply for 50Hz operation. For 60Hz operation, the specifications have to be multiplied by the factor 1.2. The max. working current remains unchanged

- Take account of the max. operating current / max. power consumption when designing contactors, leads and fuses.
Switches: Service category AC3

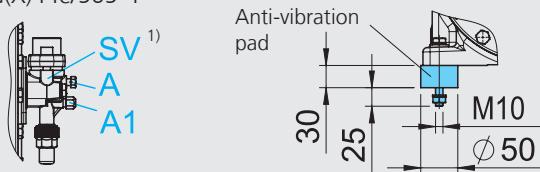

③ 380-420 V Y/ YY - 3 - 50 Hz PW
440-480 V Y/ YY - 3 - 60 Hz PW
PW = Part Winding, motors for part winding start
(no start unloaders required)
- Winding ratios: 70% / 30%
- Designs for Y/Δ on request

④ For soldering connections
